Imagine yourself being in a completely dark space. A space with walls so thick that it is impossible for the sun to infiltrate the heavy and foglike darkness. You cannot see the end of it and you cannot recognize the size of it. If you took your hand on the wall you would feel a cold and uneven surface, just like the one you are standing on. Sometimes the sound of dripping water echoes around you and slowly disappears. The attempt to stretch out your arms above you fails and the height of the room remains a mystery.

You could try to navigate by sliding your hand against the wall as you move, but you wouldn't know where you were going, for how long you would be walking and if the ground beneath your feet at one point would be gone.

Two overlays / walkway

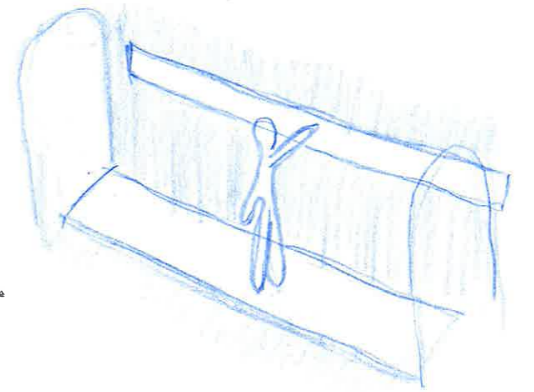

- ① - Flat concrete in dark areas where you need a steady overlay.
- In areas where you are guided around the complex.

- ② Natural rock ground existing.
- used between walkway and functions.
- in areas with more light.

How to light?

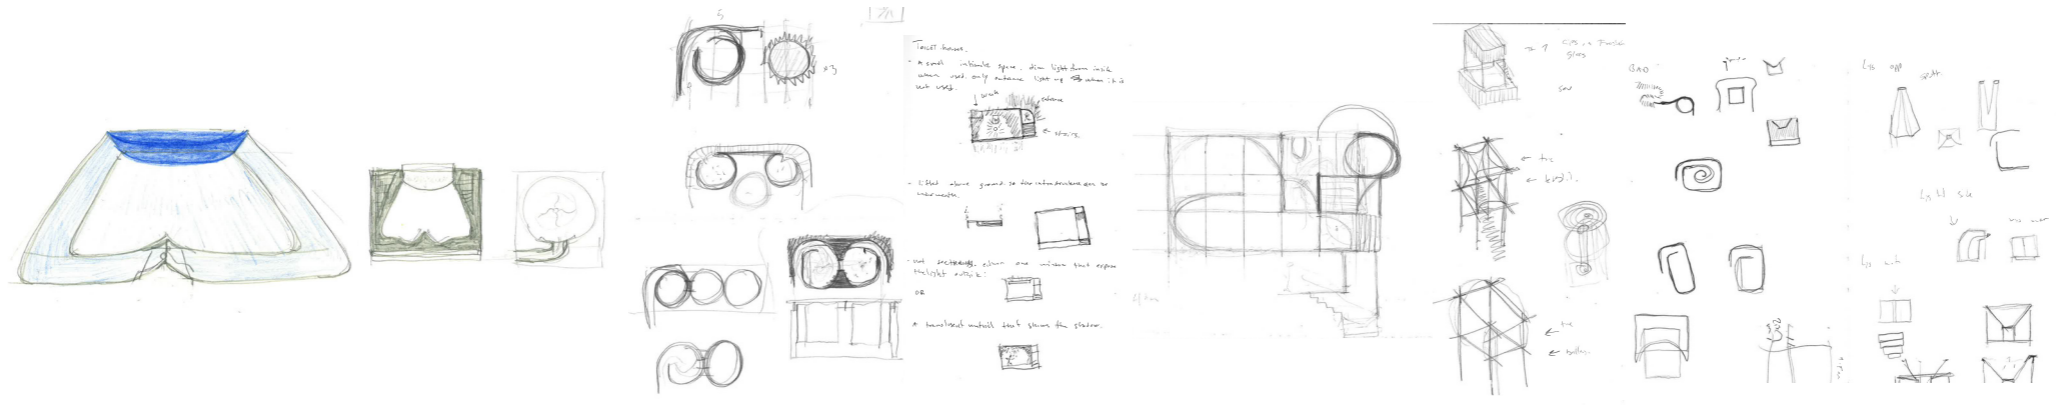

- ① slim: lys, material.
- ↳ lower: how better use?
- ↳ felt: to be from i. n. k. l. e. n.
- ↳ better: how sir more pi? how can use sun beam.
- ↑ infra structure: de upste ronne, de lyse ronne, de midf. ronne.
